PYTHON! YOU'RE FLYING! HOW? I DUNNO ... DYNAMIC TYPING? I JUST TYPED import antigravity WHITESPACE? THAT'S IT? COME JOIN US! PROGRAMMING ... I ALSO SAMPLED I LEARNED IT LAST IS FUN AGAIN! EVERYTHING IN THE NIGHT! EVERYTHING IT'S A WHOLE MEDICINE CABINET IS SO SIMPLE! NEW WORLD FOR COMPARISON. UP HERE! HELLO WORLD 15 JUST print "Hello, world!" BUT I THINK THIS BUT HOW ARE IS THE PYTHON. YOU FLYING?

Getting started

For our Python introduction we're going to pretend to be a researcher studying inflammation in patients who have been given a new treatment for arthritis.

You need to download some files to follow this lesson:

- 1. Make a new folder in your Desktop called python-novice-inflammation.
- 2. Download python-novice-inflammation-data.zip and move the file to this folder.
- 3. If it's not unzipped yet, double-click on it to unzip it. You should end up with a new folder called data.

(日本本語を本書を本書を、日本の(の)

- 4. You can access this folder from the Unix shell with:
- \$ cd && cd Desktop/python-novice-inflammation/data

Launching Jupyter Notebook

There are several ways that we can use Python. We're going to start with a tool called Jupyter Notebook that runs in the browser. In a shell window enter these commands:

\$ cd
\$ cd Desktop/python-novice-inflammation/data
\$ jupyter notebook

The shell window is now running a local web server for you. Don't close it. You will need to open another shell window to do other command line things. Your browser should open to an "Jupyter: Notebook" page showing a list of directories.

Analyzing patient data

- 1. Explain what a library is, and what libraries are used for.
- 2. Load a Python library and use the things it contains.
- 3. Read tabular data from a file into a program.
- 4. Assign values to variables.
- 5. Select individual values and subsections from data.
 - import numpy
 - numpy.loadtxt(fname= delimiter=)
 - weight_kg = 55
 - print('weight in kg:', weight_kg)
 - weight_lb = 2.2 * weight_kg

- type(data)
- data.shape
- data[0,0], data[0:1,0:1]

- data[0:10:2,1]
- data[:3,36:]

Analyzing Patient Data cont'd

- 6. Perform operations on arrays of data.
- 7. Display simple graphs.
- data.mean()
- data.std()
- data.mean(axis=0)
- %matplotlib inline
- from matplotlib import pyplot
- pyplot.imshow(data)
- pyplot.show()

pyplot.plot(ave_inflammation)

・ロト ・ 同 ト ・ 三 ト ・ 三 ・ うへの

- import matplotlib import pyplot as plt
- plt.subplot(1,3,1)
- plt.ylabel('average')
- plt.show()

Day 2

Create a single plot showing 1) the mean for each day and 2) the mean + 1 standard deviation for each day and 3) the mean - 1 standard deviation for each day.

Repeating actions with loops

- 1. Explain what a for loop does.
- 2. Correctly write for loops to repeat simple calculations.
- 3. Trace changes to a loop variable as the loop runs.
- 4. Trace changes to other variables as they are updated by a for loop.

Python has a built-in function called range that creates a list of numbers: range(3) produces [0, 1, 2], range(2, 5) produces [2, 3, 4], and range(2, 10, 3) produces [2, 5, 8]. Using range, write a loop that prints the first three natural numbers:

Storing Multiple Values in Lists

Learning Goals

- 1. Explain what a list is.
- 2. Create and index lists of simple values.

- odds = [1, 3, 5, 7]
- print(odds[0], odds[-1])
- for number in odds:
- names[1] = 'Darwin'
- odds.append(11)
- del odds[0]
- odds.reverse()

Turn a String into a List

Use a for loop to convert the string 'hello' into a list of letters: ['h', 'e', 'l', 'l', 'o'] Hint: You can create an empty list like this: my_list = []

Analyzing Data from Multiple Files

Learning Goals

1. Use a library function to get a list of filenames that match a simple wildcard pattern.

▲ロト ▲帰ト ▲ヨト ▲ヨト - ヨー の々ぐ

2. Use a for loop to process multiple files.

- import glob
- filenames = glob.glob('*.csv')

Making Choices

Learning Goals

1. Write conditional statements including 'if', 'elif', and 'else' branches.

2. Correctly evaluate expressions containing 'and' and 'or'.

- if num > 100:
- else:
- if num > 0:
- elif num == 0:
- and
- or

How Many Paths?

What will be printed if you run this code:

Creating Functions - Defining a Function

Learning Goals

- 1. Explain why we should divide programs into small, single-purpose functions.
- 2. Define a function that takes parameters.
- 3. Return a value from a function.

Example Code

- def fahr_to_kelvin(temp):
 return ((temp 32) * (5/9)) + 273.15
- def kelvin_to_celsius(temp): return temp - 273.15

Write a function called analyze that takes a filename as a parameter and displays the three graphs produced in the previous lesson, i.e., analyze('inflammation-01.csv') should produce the graphs already shown, while analyze('inflammation-02.csv') should produce corresponding graphs for the second data set. Hint: a function can just "do" something. It doesn't necessarily need to return anything.

Testing and Documentation

Learning Goal

3. Test and debug a function.

Example Code

- def centre(data, desired):
 return (data data.mean()) + desired
- z = numpy.zeros((2,2))
- print(centre(z, 3))
- print(data.std() centred.std())
- def center(data, desired):

'''Return a new array containing the original data centered around the desired value.''' return (data - data.mean()) + desired
